

SPECIFICATION

For Preliminary Conditions see “General Regulations”:-

1. DEFINITIONS

BCSCCG	-	Bayonet Cap, Shade Carrier, Cord Grip	
DP	-	Double Pole	
ES	-	Edison Screw	
GES	-	Goliath Edison Screw	
HSOS	-	House Service Overhead System IEE	- Institute of Electrical Engineers
MCI	-	Malleable Cast Iron	
PVC	-	Polyvinyl Chloride	
QMB	-	Quick Make and Break	
SP	-	Single Pole	
VRI	-	Valcanised Rubber Insulated	

2. CLASS OF WORK

All work shall comply with this Specification and be finished complete and ready for service, to the entire satisfaction of the Superintending Officer and in such sections and manner as to suit building operations or the convenience of occupants.

All work shall conform to the best principles of modern practice and be executed by fully qualified electrician.

Installations shall comply, except as modified herein, with:

- (a) the latest local regulations for electrical equipment in building.
- (b) the latest local issue of the IEE regulations.
- (c) the local Electricity Authority's regulations.
- (d) the requirements of the Fire Protection Officer.
- (e) all local regulations for the safety of the public.

SPECIFICATION

3. MATERIALS

All materials shall be of approved manufacture and shall comply, except as modified herein, with:

(a) British Standard – Where a British Standard specified in this section is no longer applicable the latest British Standard that supersedes the Standard specified herein is applicable.

(b) British Standard Code of Practice CP 326 : 1965.

(c) (i) All materials, fittings, appliances and accessories shall be uniform of their kind throughout an installation, suitable for the electricity supply to which they are connected, and similar parts shall be interchangeable.

(ii) All items covered by this Specification shall be subjected to inspections and test of materials and workmanship prescribed in the Specifications and the ‘Conditions of Contract’ issued with it, unless otherwise specified, inspections and tests considered necessary will be carried out by the Superintending Officer

The Contractor should submit to the Superintending Officer a detail of the items it is proposed to use, stating maker's name and catalogue numbers. The Superintending Officer will decide whether inspection of the stores shall be waived, inspection made at the Manufacturer's or Contractor's premises, or whether samples are to be submitted to him for approval.

When samples are called for by the Superintending Officer those approved will be retained by him as a standard for inspection of bulk supplies for subsequent incorporation. Samples not approved will be returned to the Contractor who will be required to furnish further samples.

SPECIFICATION

3. MATERIALS (Cont'd)

(ff) All 'Besam' references refer to product catalogues by An ASSA ABLOY Group Company.

(gg) All 'Crawford' references refer to product catalogues by Crawford Spares Production Holland Postbus 120 NL-1700 AC Heerhugowaard.

4. FIXING OF FITTINGS SWITCH AND FUSE GEAR, ACCESSORIES, ETC.

(a) All cable and conduit runs shall be kept clear of all water and gas pipes and at least 150mm clear of and if possible below steam and hot water lines.

(b) Conduit boxes shall be used for attaching ordinary fittings and accessories to conduit systems. Lighting fittings with conduit or similar suspension shall be suspended so that the weight of the fitting is not taken by the conductors.

For the attachment of very heavy fittings, the Superintending Officer will decide the method of fixing to be adopted.

On ceilings, etc., where blocks or boxes cannot be secured directly to a joist, etc. a bridging piece shall be fixed securely between the joists, for the purpose of mounting the blocks or boxes.

(c) Switch-fuses, distribution boards and meters shall be mounted on plywood boards of suitable sizes. Boards shall be free from defects and finished two coats of shellac. Fixing shall be of wood screws, coach screws or otherwise as considered necessary by the Superintending Officer.

5. CEILING FANS AND REGULATORS

(a) Each ceiling fan and regulator shall be controlled by a local switch. Regulators and control switches shall be mounted together on a suitable plywood board.

(b) Suspension hooks ('U' brackets) shall be made of mild steel of not less than 13mm diameter, finished two coats of metallic paint.

(c) Ceiling fan points shall terminate with a 3 plate ceiling rose, to allow for connection of earth wire and 3-core flexible cord.

(d) The rates for ceiling fan include 5 amp. plastic connectors.

SPECIFICATION

6. WATER COOLERS AND WASH BOILERS

(a) The wiring to a water cooler or wash boiler connectors to a DC supply, shall terminate with a switch socket outlet, surface mounted indicating type, with conduit entry or bushed for PVC cables, as applicable.

(b) The wiring to a water cooler or wash boiler connected to an AC supply, shall terminate with a 13 amp AC switch socket outlet enclosed in a metal-clad box, (conduit entry or bushed for PVC cables, as applicable) complete with lampholder, faceted ruby lens and fused plug.

7. WATER HEATERS (AC)

(a) Water heaters (single phase) shall be controlled by a double pole switch, complete with LED indicating lamp, mounted as one unit. Rated as required for the loading. Conduit or bushed entries, as applicable. The wiring between the control switch and water heater, shall be as applicable to the system of wiring PVC cables or VRI cables enclosed in conduit. Flexible cords shall not be installed.

(b) For a water heater installed in a room containing a fixed bath or showers, the control switch shall be sited in an accessible position outside and immediately adjacent to the normal access door. In addition to the control switch, a totally enclosed pilot lamp unit – shall be installed adjacent to the water heater. Conduit or gland (PVC cables), entries, as applicable.

(c) The exact position of control switches and pilot lamp units shall be as determined by the Superintending Officer.

8. STEEL CABLE TRUNKING

(a) Steel trunking shall be constructed from not less than 16 gauge mild steel of best quality.

(b) Sizes and gauges of trunking which are to Manufacturer's standard shall be approved by SISIR and embossed with SISIR mark.

(c) Steel trunking shall be painted with one coat of red oxide primer and two coats of approved paint.

(d) A continuous run of 25mm wide x 3mm thick tinned copper strip shall be installed and extended to the full length of the trunking to ensure earth continuity. Jumper links will not be accepted.

(e) Trunking shall be rigidly fixed to mild steel angle hangers spaced at adequate intervals on wall or under floor slab. A suspension unit and a thrust block shall be provided at the top and bottom of each vertical run of trunking where required.

SPECIFICATION

8. STEEL CABLE TRUNKING (Cont'd)

(f) When trunking passes through a fire wall or floor slab a barrier of consistence fire rating shall be installed to prevent the possible spread of fire. Joints and bends shall be so constructed that cables can be easily drawn through. The number of cables installed in each (45%) is not exceeded. The supply and installation of trunking shall be fully in compliance with the special requirements as listed in the latest SISIR CODE CP5.

(g) Trunkings shall be supplied in length to suit the installation and cover plates shall be supplied in short length for easy removal. Every entry to finished trunking shall be so placed as to prevent the ingress of water. Cover plates shall be securely fixed after wiring is completed.

9. CABLE TRAYS

(a) Cable trays shall be of the hot dipped galvanised and perforated type and constructed of not less than 17 swg galvanised sheet steel supported at 1m intervals by mild steel hangers fixed to walls and floors in an approved manner. The cable trays and the finished steel hangers shall be painted with two coats of primer and Electric Orange paint respectively prior to the installation.

(b) Long bends shall be used for all turnings. When cable tray passes through a fire or floor slab, a fire resisting barrier shall be installed to prevent the possible spread of fire.

(c) All working surfaces shall be cleaned, free from burrs, etc.

10. LIGHTING SWITCHES

(a) Lighting switches shall normally be rocker operated and of 10 Amp rating to BS 3676, with ivory moulded strong polycarbonate cover plates.

All switches shall be mounted at a height of 1450mm above floor finished level or as directed by the Superintending Officer. However, due consideration must be given to heights of tiling. No switches are allowed to be located at the joint or junction of wall tiling, demountable partition or different finish. Adjacent switches must be grouped in accordance with phase sequence or as directed by the Superintending Officer.

(b) Boxes for slush mounted switches shall be galvanised mild steel to BS 4662. Boxes for surface mounted switches shall be either moulded PVC or galvanised mild steel.

(c) Switches where exposed to weather or installed near the water tank rooms shall be of weatherproof type.

SPECIFICATION

11. SOCKET-OUTLETS

(a) 13 Amp. 3 pin AC polycarbonate socket outlets/combined switch socket outlets to BS 1363 complete with boxes to BS 4662 and fused plug, shall normally be installed for all AC installations.

Socket-outlets connected to a conduit wiring system shall be mounted in metalclad enclosure, for other systems (PVC or VRI cables on cleats), the enclosure shall be all insulated. Socket-outlets, other than the above type, will only be installed with the Superintending Officer's approval.

(b) Socket-outlets connected to DC installation shall be of the combined switch socket-outlet type, with QMB, switch, enclosure as applicable, complete with plug (Round Pins).

(c) Socket-outlets controlled by a switch shall normally be of the combined switch socket-outlet type. When a separate switch is installed for the control of a socket-outlet, the switch rating (Amps.) shall be equal to the maximum rating of socket-outlet.

12. LIGHT FITTINGS

All light fittings shall comply with the relevant sections of BS 4533 and include 5 Amp. High temperature rated connectors.

(a) Fluorescent Fittings

All fluorescent lighting fittings shall be complete with tubes, control gear, lamp holders and accessories suitable for operation at 230 volt, single phase, 50 cps supply and shall comply with the requirements as follows:

(i) Housings and Reflectors

The housing and reflector where required, shall be manufactured from best quality mild steel sheet or not less than 20 swg.

The housings shall completely enclose the control gears, wiring and accessories.

The entire housings and reflector where required, shall be specially treated to prevent rust and corrosion. One coat of anti-rust primer and two coats of finishing paint of best quality shall be applied.

SPECIFICATION

12. LIGHT FITTINGS (Cont'd)

(ii) Plastic Diffusers

Plastic diffusers shall be made of best quality plastic material recommended for lighting service equivalent to ICI Acrylic. They shall be of adequate thickness and strength to prevent sag under normal operation.

Unless otherwise stated all acrylic diffusers for fluorescent fittings shall be of the Carolite C12 Type or other equal and approved.

(iii) Control Gear

The method of construction of all control gear shall comply with BS 2467 as regards to the safety aspect.

1. Ballasts

All ballasts shall be of indoor, natural cooling and polyster-filled type, Class A insulation and comply with the latest British Standards.

Ballasts shall operate without audible hum or noise and each lamp shall be completed with one ballast.

2. Capacitors

All capacitors shall comply fully with BS 4017 and shall be suitable to correct power factor to not less than 0.85 lagging.

Capacitors shall be satisfactorily withstand baking in an oven at 85 degrees C for twenty-four (24) hours showing no sign of leakage or other deterioration.

3. Starters

All starters shall comply fully with BS 3772 : 1964.

The canister shall be made of high temperature matt with polypropylene and shall be electrically safe and non-corrodible. A ceramic disc type radio interference suppression capacitor shall be fitted internally to each canister. Waxed paper and foil type capacitor will not be accepted.

(iv) Fluorescent Tubes

All fluorescent tubes shall be of bi-pin type having a diameter of 26mm and a rated life of not less than 8,000 hours. The type of tube shall be selected at a later date.

SPECIFICATION

12. LIGHT FITTINGS (Cont'd)

(a) Fluorescent Fittings

(iv) Fluorescent Tubes

The lumen output of each type of tube shall be in compliance or better than the following requirements:

1	Initial Lumens	600	1200	1500
		18/20 W	36/40 W	58/80 W
	White	1150	2800	5400
	Warm White	1150	2800	5300
	Daylight	1100	2700	5100
2	Design Lumens	600	1200	1500
		18/20 W	36/40 W	58/80 W
	White	1050	2600	4900
	Warm White	1050	2600	4800
	Daylight	1000	2500	4600

3 Design Lumens

All fluorescent tubes shall comply with the relevant British Standard Specification.

(v) Wirings

All internally connected and control wiring except the main cables shall be of high temperature grade sleeving. The minimum size shall not be less than 2.5mm².

(vi) Lamp Holders

All lamp holders shall comply with BS 1875, be of robust construction suitable for mounting standard bi-pin lamps and of the rotary type.

They shall be designed to have a firm lamp support and good electrical contact. Each holder shall be provided with a spring-loaded rotor.

Lamp holders shall be securely fixed to the housing/reflector to ensure that the lamp holders will not spread with the lamp insulation.

(vii) Accessories

Terminal blocks, nickel plated spring clips, plastic sleeve and other necessary accessories which are required for the proper construction and operation of lighting fittings shall be provided.

SPECIFICATION

12. LIGHT FITTINGS (Cont'd)

(b) Incandescent Fittings

All incandescent fittings shall be complete with lamps, lamp holders, glassware and accessories.

All general lighting service lamps shall be manufactured to BS 161 : 1968.

Unless otherwise specified, all lamps shall be suitable for operation at 240V. All lamps below 100W shall be of BC cap and above shall be of ES or GES cap.

All incandescent lamps shall be equivalent to OSRAM and have a working life of not less than 1,000 hours.

(c) Testing

All light fittings shall be tested on completion of the installation for not less than three hours.

13. EARTHING

(a) Earthing, as required for the installation, shall be in accordance with the applicable section of IEE Regulations.

(b) Earthing leads may be connected to metal water pipes or metal rods (driven in the ground), as ordered by the Superintending Officer.

Where a water meter is incorporated in a water service, a suitable bond shall be provided across the meter.

Clamps used for connections to water pipes (not exceeding 95mm diameter) shall comply with BS 951.

Connections shall be painted with two coats of bitumastic paint, after inspection by the Superintending Officer.

(c) Earth wires shall be tinned stranded copper, with the following exception, minimum size of wires shall be 2.5mm².

The earth-continuity conductor within the room containing a fixed bath or shower shall be a minimum size of 4mm².

Earth wires shall be secured by non-ferrous staples or clips, as applicable. Staples or clips shall be spaced at intervals not exceeding 380mm and within 100mm of each connection or right angled bend.

SPECIFICATION

14. TESTING

(a) General

All tests shall be made in the presence of and to the satisfaction of the Superintending Officer. The Contractor shall supply all necessary labour, apparatus and instruments necessary for the prescribed tests. The Superintending Officer shall be at liberty to use for testing, any instruments or testing apparatus that he may consider necessary to carry out the prescribed tests.

(b) Internal Electric Lighting And Power Installations

The following tests shall be carried out on each installation, as applicable and the results recorded in duplicate, which shall be signed by both the Contractor and the Superintending Officer.

- (i) Insulation resistance test to earth of the complete installation.
- (ii) Insulation resistance test between conductors of the complete installation.
- (iii) Continuity test of all 'Ring Circuit' conductors.
- (iv) Polarity test of single-pole switches and connections to socket-outlets.
- (v) Earth continuity and earth fault loop tests of the installation, including earthing clamps.

(vi) Resistance test of earth electrodes.

(vii) Full load tests of lighting and power circuits.

(c) Electric Bell And Alarm Installation

Ring and indicator tests on bell and alarm circuits.

(d) Overhead LT Distribution Systems

Completed installations shall be tested in accordance with the tests prescribed by the Electricity Authority and such other tests as may be required by the Superintending Officer, before being connected to the supply.

(e) Lightning Protective Systems

When the installation of Lightning Protective Systems has been completed, to the entire satisfaction of the Superintending Officer, the Contractor shall carry out the following tests in the presence of the Superintending Officer

SPECIFICATION

14. TESTING (Cont'd)

(f) Lightning Protective Systems

With all test points disconnected from earth terminations, carry out continuity resistance tests between all test points, using a continuous current of 10 Amps.

With all test points disconnected, carry out earth resistance tests of each earth electrode. Where earth electrodes are bounded together they shall be classified and tested as one earth termination. Earth resistance tests shall be carried out in conformity with BS Code of Practice 326 : 1965 using a hand generating AC earth tester. Before the installation is finally handed/taken over, and after the above mentioned tests have been satisfactorily performed, the Contractor shall prepare and hand to the Superintending Officer a certified statement, in duplicate, showing full details and results of tests carried out.

15. BUILDERS WORKS

(a) Installation shall be deemed to include all cutting away, plugging and making good of walls, ceilings and other structural features where necessary.

(b) This work shall be of the smallest amount possible consistent with requirements and when installation is completed shall match existing surroundings and be as inconspicuous as possible.

16. PVC INSULATED AND SHEATHED WIRING SYSTEMS (SURFACE MOUNTED)

(a) General

The system of wiring shall consist of single core PVC insulated and sheathed cables, fixed in conduits or PVC trunking (high UV resistance).

The 'loop-in' method of wiring shall be employed, but approved type spur (Ring Circuit) or junction boxes may be used where specifically authorised.

Normally the cables shall be carried in conduits fixed to the surface of walls and ceilings, but where conditions permit and with the Superintending Officer's approval, cables may be fixed with battens on galvanised steel saddles and brass screws to the timber structure of a building.

(b) Cables

All cables shall be Polyvinyl Chloride Insulated and Sheathed complying with BS 6004.

SPECIFICATION

16. PVC INSULATED AND SHEATHED WIRING SYSTEMS (SURFACE MOUNTED) (Cont'd)

(b) Cables (Cont'd)

Single strand conductors will not be permitted.

The minimum size of conductors shall be 1.5mm² and the minimum size of sub-mains, 2.5mm².

(c) Battens

Battens shall be wrought on face and both edges, the width and thickness will depend on the size and number of cables to be mounted, as follows:

(i) Battens up to 150mm wide carrying single core cables up to 4mm² shall be 10mm thick.

- (ii) Battens up to 150mm wide carrying single core cables over 4mm² but under 16mm², shall be 13mm thick.
- (iii) All battens carrying single core cables 16mm² or over shall be 19mm thick.
- (iv) Battens shall be of sufficient width to allow screws securing saddles to be fixed without splitting the batten edges.
- (v) Battens secured to steel joists, beams or stanchions shall preferably be the full width of the joist, etc.

(d) Fixing Battens

- (i) Battens shall be fixed to walls, ceilings, etc. by means of 38mm No. 10 countersunk brass screws, spaced at 610mm intervals. Battens over 150mm wide, two 38mm No. 10 countersunk brass screws shall be fixed in line across the width of the batten at 610mm intervals. Approved type fibre plugs, securely fixed, shall be used for fixing battens to concrete or brickwork.
- (ii) Battens fixed to steel work, steel joists, beams or stanchions shall be secured to the steel work by approved means.

SPECIFICATION

16. PVC INSULATED AND SHEATHED WIRING SYSTEMS (SURFACE MOUNTED) (Cont'd)

(e) Fixing Cables

Cables shall be fixed to battens or timber structure, by means of galvanised steel saddles secured with brass screws.

- (i) Saddles shall be spaced as follows:

Nominal Cross Sectional Area Of Conductor	Standard No. & Dia. (Ins.) of Wire Forming Conductor	Max. Spacing Of Saddles	
		Hor. Runs	Vert. Runs
		mm	mm
1.5mm ²	1/1.38	230	380
2.5mm ²	1/1.78	230	380
4mm ²	7/0.85	230	380
6mm ²	7/1.04	305	380
10mm ²	7/1.35	305	380
16mm ²	7/1.70	380	455
25mm ²	7/2.14	380	455
35mm ²	19/1.53	380	535
50mm ²	19/1.78	455	535
70mm ²	19/2.14	455	535
95mm ²	19/2.52	455	535
120mm ²	37/2.03	455	535
150mm ²	37/2.52	455	535
185mm ²	37/2.52	455	535
240mm ²	61/2.25	455	535

A saddle shall be fixed within 76mm on either side of fittings, accessories or right angled bends.

SPECIFICATION

16. PVC INSULATED AND SHEATHED WIRING SYSTEMS (SURFACE MOUNTED) (Cont'd)

(e) Fixing Cables

(ii) The maximum number of cables which may be fixed under one saddle is as follows:

1.5mm2 and up to 4mm2 - 8 number

6mm2 and up to 25mm2 - 4 number

35mm2 and over - 2 number

(f) Erection

No diagonal routes will be permitted and only such runs as may be required to feed a point may be taken across ceilings.

Cables shall not be run as a span between beams or trusses etc. unless fixed to a timber batten.

Cables carried along or across steel joists, beams or stanchions shall be secured to a timber batten.

Where there is a change of direction likely to cause excessive pressure on any part of the cable, the cable shall be brought over a rounded support of a radius not less than six times the overall diameter of the cable.

(g) Cable Protection

(i) Cables exposed to a risk of mechanical damage or installed less than 1.83 metre above floor level, shall be protected by heavy gauge welded screwed galvanised steel conduit. All cables installed in Workshops shall be protected by similar conduit to a height of 2.4 metre from floor level. Conduit ends shall be bushed with brass bushes.

(ii) Where cables pass through a floor, wall, partition or ceiling, they shall be protected by bushed conduit and the hole made good with cement or other incombustible material, as applicable.

(iii) Where cables are laid in concrete or similar flooring they shall be protected by welded screwed galvanised steel conduit and boxes to BS 31 galvanised or enamelled, as ordered.

SPECIFICATION

17. CONDUIT SYSTEMS OF WIRING

NOTES:

This clause does not include Flameproof and Dust-proof installations.

(a) General

The system of wiring shall consist of single core PVC or VRI cables in screwed galvanised steel conduit, of not less than 19mm diameter, chased or surface mounted as required.

The 'loop-in' method of wiring shall be employed, but approved type spur (Ring Circuit) or junction boxes may be used where specifically authorised.

(b) Cables

All cables shall be single core VR taped, braided and compounded, complying with BS No. 7 or PVC insulated and sheathed complying with BS 6004.

Single strand conductors will not be permitted. The minimum size of conductors shall be 1.5mm² and the minimum size of sub-mains, 10mm².

(c) Conduit And Conduit Fittings

(i) All galvanised screwed conduit and conduit fittings shall comply with BS 31. Conduits shall be Class 'B' heavy gauge screwed welded.

(ii) Flexible metal conduits shall comply with BS 731 Part 1 and shall be used from the lighting boxes to the lighting fittings.

(iii) Standard conduit boxes and covers shall be of galvanised steel, draw-in boxes tapped 32mm and above shall be oblong. Covers shall be secured by brass screws.

(iv) Multiple way conduit or switch boxes, instead of a series of single boxes shall be utilized at positions where more than one accessory is mounted.

(v) Solid elbows or tees will not be permitted.

(vi) Spacer-bar saddle plates shall be 3mm thick for conduits up to 38mm diameter and 5mm thick for larger sizes of conduit. Saddle tops shall be secured by brass screws.

(vii) All conduit, fittings and accessories shall be galvanised. Conduit boxes shall have machine faced joints between the box fitting or cover.

SPECIFICATION

17. CONDUIT SYSTEMS OF WIRING (Cont'd)

(d) Erection

(i) All conduit, fittings and accessories shall be erected before cables are drawn in. The maximum number of cables allowed in the conduits shall be in accordance with IEE Regulations.

(ii) Conduits shall be run horizontally or vertically. Diagonal runs will not be permitted and particular attention shall be given to 'sets' which shall fit as close to the walls, etc. as possible.

(iii) Conduit systems shall be erected as far as possible to avoid areas where water may accumulate from condensation.

Systems not intended to be gas tight shall be self-ventilating, and drainage outlets shall be provided at any points in the installation where condensed moisture might otherwise collect.

(iv) Surface mounted conduit shall be secured by spacer-bar saddles, except where conduit is installed on steel work.

Spacer-bar saddles shall be fixed at 1.2metre intervals, with a saddle within 100mm of a fitting or accessory, and secured by brass screws, minimum length 2.5mm. Suitable metal clips, fixed at 1.2metre intervals with a clip within 100mm of a fitting or accessory shall be provided for fixing conduit to steelwork.

(v) All joints shall be such as to ensure perfect continuity and where running joints are necessary, locknuts shall be utilized.

Screwed connections shall be metal to metal. Exposed threads, and in places where galvanizing or enamelling has been damaged, shall be thoroughly cleaned and then painted with two coats of anti-corrosive paint. This treatment shall be applied as the work is proceeding.

(vi) Conduit boxes with locknuts, shall be provided at suitable places to allow for subsequent extension without undue dismantling of the system.

Conduit boxes shall be spaced so that there is not more than 9.14 metre straight run between them.

- (vii) Connection between conduit and screwed metal boxes not provided with entry spouts, shall have a PVC bush or a brass external bush fitted inside the box secured by an external locknut.

SPECIFICATION

17. CONDUIT SYSTEMS OF WIRING (Cont'd)

(d) Erection

Alternatively, the connections shall have a PVC bush or a brass hexagon smooth bore bush fitted inside the box, connected through a coupler to the conduit. Connection between conduit and boxes with clearance holes, will, in addition, be fitted with a brass or plastic compression washer between the box and coupler or locknut.

- (viii) Where conduit passes through a wall, floor, partition or ceiling, the hole shall be made good with cement or similar incombustible material to the full thickness of the wall, floor, partition or ceiling. Space through which a fire might spread shall not be left.

- (ix) Exposed conduits shall have the threads coated with two coats of aluminium paint.

(e) Concealed Conduit

Conduit shall be chased in walls, floors, etc. to such a depth that there is a minimum of 10mm cover and shall be secured by means of pipe hooks fixed at 1.22metre intervals, with a pipe hook within 100mm of each fitting or accessory.

The covers of all boxes sunk in walls ceilings, etc., shall fit flush with the finished surface.

Plates of flush type switches and socket-outlets shall overlap the edges of the sunk box and fit flush with the wall surface at all points.

All threads shall be coated with an approved compound before fixing and all joints shall be painted with one coat of anti-rust paint after jointing.

(f) Bonding And Earthing

All conduit systems shall be electrically continuous throughout the installation. The maximum conductivity resistance of the conduit, together with the earthing lead, shall not exceed 1 ohm.

18. FLAMEPROOF AND DUST-PROOF INSTALLATIONS

(a) Types Of Installations

- (i) Building containing explosives are divided into two types in regard to electrical installations, viz:

Those requiring a flameproof installation.

SPECIFICATION

18. FLAMEPROOF AND DUST-PROOF INSTALLATIONS

(a) Types Of Installations

Those requiring a dust-proof installation.

- (ii) Flameproof installation shall be installed in all buildings containing explosives, the manufacture or storage of which may involve the presence of inflammable liquids or gases.

(iii) Flameproof equipment shall comply fully with the requirements of the Superintending Officer and the Local Authorities and when applicable, BS 889.

(iv) Flameproof installations shall conform to BS Code of Practice 1003 – Installation and Maintenance of Flameproof and Intrinsically-safe Electrical Equipment, for industries other than coal mining.

- (v) Dust-proof installation shall be installed in all buildings containing explosives not requiring a flameproof installation.

(b) Danger Buildings

(i) No electrical conductors or apparatus shall be permitted within any building in which explosive dust is liable to evolve, or nitroglycerine to be condensed, such as corning-houses, gun-cotton and cordite stores, and no apparatus shall be placed within a dusty area external to any such building unless precautions can be taken to prevent deposit of dust on the apparatus.

(ii) Subject to clause (i) lighting fittings may be placed in a danger building provided they are of the appropriate type complying with this Specification. Switches and fuses may be placed within a suitable entrance porch or in a room where no explosive or inflammable material is permitted and where no explosive vapour has access. Where no such position is available they must be placed outside and adequately protected from the weather.

(c) Supply

In a danger area the pressure of the system of supply shall be such that the pressure to earth does not exceed 250 volts. In the cases of 3-wire DC and 3-phase 4-wire AC systems, when the neutral conductor is not earthed, the pressure shall not exceed 250

volts and an earth leakage indicating device shall be provided

SPECIFICATION

18. FLAMEPROOF AND DUST-PROOF INSTALLATIONS (Cont'd)

(d) Distribution

(i) The supply of electricity to a building containing explosive shall be controlled by a master switch out-side the building and this switch shall be capable of isolating every conductor entering the building.

(ii) All circuits and sub-circuits shall be adequately protected against the effect of excess current or earth leakage current. In danger areas and danger buildings, earth leakage protection shall be provided where, by such provision appreciable reduction in fault setting can be secured.

(iii) No underground main or cable for any purpose other than a service cable shall be laid within 3metre of any danger building.

(iv) Service connections to danger buildings shall be by cables protected by armour or iron pipes except where special conditions such as chemical contamination of the soil is likely to lead to corrosion. In these cases cables shall be protected adequately to the satisfaction of the Superintending Officer by an approved means.

(v) The armouring or piping shall be efficiently earthed. In the case of pipes containing non-armoured cables, precautions shall be taken against access of moisture. Cable in which bitumen is used as insulating material shall not be used.

(e) Fittings

(i) All lighting fittings shall be so proportioned that when lamps are burning continuously the temperature of any external part shall not exceed 85 degrees Celcius.

(ii) All lighting fittings shall be securely screwed to the metal conduit, and firmly attached to the wall or other supports. Flexible pendant fittings shall not be permitted.

(f) Conduit System Of Wiring For Flameproof And Dust-Tight Installations

(i) All wiring shall be run on the surface of walls, etc. and sited so as to reduce to a minimum risk of accidental damage.

(ii) Wiring shall be in VR taped, braided and compounded cables, complying with BS No. 7 or PVC insulated and sheathed cables complying with BS 6004 enclosed in conduit, except in places where heavy condensation occurs or the fixing of conduits is impracticable.

SPECIFICATION

18. FLAMEPROOF AND DUST-PROOF INSTALLATIONS (Cont'd)

(f) Conduit System Of Wiring For Flameproof And Dust-Tight Installations

(iii) When specifically approved fire-rated mineral-insulated copper-sheathed cables, (MICS) complying with BS 6207 Part 1 shall be used where conduit is impracticable, for the reasons given in (b) above.

(iv) Conduit and conduit fittings shall be as described in Clause 17 (c).

(v) Where conduits pass from a danger area to a safe area, a flameproof type sealing box or barrier shall be inserted where the conduit enters the safe area.

(vi) The joint between cover and box shall be machined flat and smooth and shall not be less than 5mm width. Fixing screws shall be external to the joint surface.

(vii) Drainage holes in conduit shall be closed by iron plugs, which shall be galvanised and made captive by a chain secured to the conduit. The joint between plug and conduit shall be flat and smooth and smeared with a high melting-point grease to prevent rust and ensure 'dust-tightness'.

(x) Conduit shall be screwed into conduit boxes and in the gland boxes of all other enclosures, against a shoulder provided for the purpose, and the conduit end shall be faced to ensure a tight metal joint. A machine-faced locking nut shall be provided on coupler and running joints.

19. BELL AND ALARM WIRING SYSTEMS

(a) General

(i) Any bell wiring connected directly (e.g. without the intervention of a double wound transformer or double wound converter) to an electricity supply system shall be installed in accordance with IEE Regulations as applicable to Electric Lighting and Power Installations, herein specified.

(ii) Low voltage bell and alarm circuits shall be isolated electrically from the electricity supply by means of a double wound transformer or a converter, and shall not normally be subject to a pressure exceeding 15 volts.

(iii) Where electric bell and/or similar alarm apparatus are connected to the electricity supply system by means of a transformer or converter, the primary wiring shall be installed in accordance with IEE Regulations as applicable to Electric Lighting and Power Installations, herein specified.

SPECIFICATION

19. BELL AND ALARM WIRING SYSTEMS (Cont'd)

(b) Low Voltage Bell And Alarm Wiring Systems

Wiring shall be installed using single core PVC insulated cables minimum size 1.5mm². Wires shall be secured with PVC or fibre insulated staples.

The 'loop-in' method of wiring shall be used throughout.

(c) Erection

(i) Staples shall be spaced at intervals not exceeding 305mm and shall be fixed so as to avoid damage to the insulation of the bell wires. Bell wiring secured by staples shall be strained hand tight and fixed without sag.

(ii) Where bell wires pass through walls, floors or ceilings or are exposed to mechanical injury, they shall be protected by means of screwed steel conduit, as described, suitably bushed.

(iii) Joints in bell wires shall normally be soldered, but approved pattern junction boxes may be used with the approval of the Superintending Officer.

(d) Sitting Of Transformers, Batteries, Bells, Indicators

Transformers, batteries, bells and indicators shall be sited where they are not exposed to water, oil, steam or vapour, or to risk of mechanical damage.

(e) Mounting Of Fittings And Accessories

Ordinary bell fittings and accessories shall be mounted directly to concrete wall to approved design and finish.

20. LIGHTNING PROTECTIVE SYSTEMS (COPPER)

(a) General

All work and materials shall conform with British Standard Code of Practice CP BS 6651 : 2006 edition or later.

(b) Roof Conductors

Shall be held in position at 1.0 metre intervals by using suitable tape clip or gunmetal material. Conductors shall be fixed external to the existing buildings and internal for new buildings

SPECIFICATION

20. LIGHTNING PROTECTIVE SYSTEMS (COPPER) (Cont'd)

(c) Down Conductors

Shall be held in position according to BS 6651 : 2006 by the applicable type of gunmetal tape clip. All conductors shall be fixed external to the building and follow the most direct path between the air and earth terminations.

There shall be no up-turn in the down conductors and bends shall be of the largest radius possible.

(d) Test Points

Gunmetal test clamps shall be fitted to all down conductors at a point 0.91 metre above ground level, tapes shall be lapped 13mm over full width of clamp. A high UV resistance I.P.55 enclosure to 'Legrand' type shall be used.

(e) Earth Terminations

The type and number of earth electrodes to be installed shall be to the latest standard and as stated on the order. Electrodes connected in parallel should be capable of isolation for test purposes. The resistance to earth of any earth termination shall not exceed 10 ohms.

(f) Fixings

Where necessary it is preferable that, gunmetal tape clips (with strap) and gunmetal ridge saddles, are fixed to ridge tiles prior to the tile being set in position.

(g) Bonding Of Metal Work

All metal work of considerable mass, situated within 305mm per ohm. of resistance to earth of the Lightning Protective System, shall be bonded together and connected to a down conductor of the system. The term 'metal work' embraces electric and water services, reinforcement fabric, metal sheets, windows, shutters, grills and similar items.

(h) Inflammable Roofs

Systems installed for the protection of structures with inflammable roofs shall comply with BS 6651 : 2006.

SPECIFICATION

LIGHTING AND POWER

LIGHTING WIRING POINTS

The rates indicated for lighting and power points include providing and fixing everything necessary for the proper execution of the work as described, and that may be required for the complete wiring from the point of supply, but exclude providing and fixing of ceiling roses, flexible cord, lighting fittings, lamp holders and shades, PVC trunking, steel tray and trunking, lamps, switches and socket outlets. The rates include for the provision of boxes for the mounting of lighting fittings and switches, except where the switch is supplied in a complete unit having its own box.

Where cables larger than 1.5mm² PVC (7/0.53) are ordered to be used, the actual difference in the Schedule of Rates for the two descriptions of cable per metre run as “materials supply only” will be allowed in addition to the rate for normal point wiring.

The rates included hereafter are for all things necessary for a complete wiring system from point of supply to light, switch or socket outlet.

The rates for conduit include the provision of all malleable iron conduit boxes and lids, all saddles and pipe hooks, all plugging and screwing and fixing complete and all bending, screwing and setting of conduit.

The rates exclude the fixing of light, switch and socket outlets and associated mild steel boxes but include the provision and fixing of malleable iron lighting outlet points.
